

User Evaluation Questionnaire results

Participants of the usability evaluation were also provided with a separate evaluation questionnaire to complete anonymously after the cognitive walkthrough. The questionnaire was designed using the trust in technology constructs of functionality, helpfulness, and reliability¹ and following the Technology Acceptance Model 2². The separate evaluation ensures that any responses, particularly those around the effectiveness or ease of use of the tool, given by the participants during the cognitive walkthrough do not differ from the participants' anonymously-provided responses and acts as a validation of the cognitive walkthrough.

Intention to use.

Perceived usefulness
